## Projects:

### Graduation project:

**Heartbeats app** is a mobile application built on a Flutter framework whose main function is to coordinate the analysis of the heart rate chart. A special model has been built that can detect up to 7 heart diseases and arrange reservations between patients and doctors. **(Dart-flutter, PHP, Python and Tensorflow lite)**

### Additional projects:

**My basket** is a mobile application built using Flutter Framework and is similar to the famous Talabat application. **(Dart-flutter and Puthon)**

**Our sales** application is a desktop application whose main function is an integrated sales system through which invoices can be issued, sales calculations can be made, the available goods can be calculated in the mall and alerts can be created about the expiry date of the products and the available quantities. **(C#, Python and PL-SQL)**

**Smart HR** is a desktop system that performs the work of the HR manager. Its function is to calculate employees' working hours, payroll calculations, and record revenues and exports. **(C#, Python and PL-SQL)**
